TOOTH ERUPTION CHART

PRIMARY TEETH:
Teeth start developing in utero.
At birth people usually have 20 primary (baby) teeth which often start erupting at around 6 months of age, but some babies have no teeth until 12 months or more.
The lower two front teeth will usually erupt before the upper ones. Then the teeth will come through in pairs, one on the right and one on the left side.
Commonly children have all of their baby teeth by the time they about three years old.

PERMANENT TEETH:
The first permanent teeth start erupting when children are around 6 years old.
Adult molar teeth grow behind baby teeth.
By 12 to 13 years most children have 28 teeth.
The last four molars or wisdom teeth usually come through between 17 and 21 years.
